National University of Computer and Emerging Sciences

Assignment No #3

Programming for AI

Fall 2026

Total Marks: 100

Submission Instructions

1. What to submit

- The completed notebook `Assignment3_Programming_for_AI.ipynb` with all cells executed and outputs visible.
- The files your notebook produces: `dashboard.png`, `dashboard.pdf`, `wave.gif`.
- A short `README.md` (maximum 150 words) saying how to run your notebook and one thing that was hard.

2. GitHub requirements

- Create a repository named `PAI-A3-` (for example PAI-A3-26K-1234). Keep it private and add your instructor as a collaborator, or make it public if told so in class.
- Repository structure: `data/` (the provided CSV and NPZ/NPY files, unchanged), `Assignment3_Programming_for_AI.ipynb`, `outputs/` (figures and gif), `README.md`.
- Make at least 6 commits spread over at least 3 different days. Commit messages must describe the change (for example "clean weather dates and fix 3-digit days"). One single upload commit is penalised by 10 marks.
- Do not commit your virtual environment or checkpoint folders. Add a `.gitignore`.
- Tag the final version with `git tag final-a3` and push the tag.

3. LMS submission

- Upload one PDF export of the executed notebook and paste the GitHub repository link on the first line of the LMS comment box.
- The commit history, not the LMS upload time, is used to verify authorship. Pushes after the deadline count as late.

4. Rules

- Individual work. Discussion of ideas is fine, copying code is not. Similar notebooks or identical mistakes will be treated as plagiarism and both students are penalised.
- You may be called for a viva of 5 minutes. You must be able to explain any line you submitted and re-run a modified version live.
- Interpretation answers must quote numbers from your own output. Answers that are generic, contradict your own outputs, or describe things not in the data will be marked zero.
- Allowed libraries: numpy, pandas, matplotlib and the Python standard library only.
- Late policy: 10 percent per day, no submissions after 3 days.

5. Marking

- Correctness 60, interpretation 20, code quality and comments 10, GitHub history and structure 10.
